Support Guide - Story Card Package

Generated on May 18, 2026

Document scope	This package was generated from the card titles provided by the user plus repo-local MCSL handoff patterns and knowledge-base references. For most cards, full Trello comments, approved AC, reviewed TCs, and AI QA evidence were not available locally, so the guide intentionally marks unknown toggles, rollout details, and exact payload nodes as Confirm from card/store context instead of inventing them.
----------------	--

Included Story Cards

Story / card	Carrier scope	Toggle / prerequisite signal
ZI-491	FedEx REST rates / auth refresh	No toggle detected locally; confirm release rollout
ZI-487	CSV / signature configuration	Confirm field scope from card/store context
ZI-007	Shopify order import / notes sync	No toggle detected locally
ZI-058	Australia Post eParcel / StarTrack	australiaPost.skip.get.shipment.enabled noted in prior support package
ZI-043	Packing slip documents	No toggle detected locally
ZI-029	Bundle product support	Confirm packing and product-source assumptions
ZI-018	DPD via EasyPost	No toggle detected locally
ZI-098	PostNL services	No toggle detected locally
ZI-038	DHL Express returns / customs	Confirm return-flow scope from card/store context
ZI-484	Subscription / billing plans	Confirm whether yearly plan rollout is enabled

Store / card	Carrier scope	Toggle / prerequisite signal
ZI-472	USPS service availability	No toggle detected locally
ZI-006	USPS service availability	No toggle detected locally
ZI-010	Subscription page / Safari UI	No toggle detected locally
ZI-475	USPS flat-rate packaging	No toggle detected locally
ZI-478	Shipment notification emails	No toggle detected locally
ZI-480	PostNord labels / CN22	Confirm document-print flow from card/store context
ZI-483	App/plugin load behavior	Confirm affected plugin/build context
ZI-490	USPS transit-time buffer	Treat as rollout-gated unless card/store confirms GA
SL item - USPS Stamps transit days	USPS Stamps checkout rates	Confirm Stamps account and checkout-rate setup
ZI-477	PostNord customs invoice	No toggle detected locally
ZI-494	DHL SOAP v2 to REST migration	REST migration must be active
ZI-495	DHL Paket REST migration	REST migration must be active
Trello 9 F0e HY SW	Confirm card title from Trello access	Confirm scope, carrier, and rollout from card/store context

How Support Should Use This Package

- › Use this guide to explain the intended change, verify it in the relevant MCSL area, and gather the right evidence before escalating.
- › Default platform is Shopify unless the card or store context explicitly says otherwise.

- › For any card below, do not promise behavior until the store is confirmed on the release or rollout path that contains the change.
- › If a card requires request-log or payload verification and the exact field is not named here, inspect the relevant request/response log and escalate with screenshots rather than guessing.

ZI-491 - FedEx REST API rate timeouts during token refresh

Feature Summary

This card covers intermittent FedEx REST rate failures when the access token refresh path overlaps with rate fetching. Support should treat the intended fix as a stability improvement: rate requests should complete without customer-visible timeout errors even when MCSL needs to refresh FedEx REST authentication in the background.

Toggles & Prerequisites

Check	What to confirm
Release	Confirm the store is on the build containing the ZI-491 fix
Carrier account	FedEx REST account is active in hamburger menu > Carriers
Platform	Default to Shopify unless the card/store says otherwise
Toggle	No toggle detected locally; confirm from card/store context

Step-by-Step Support Walkthrough

1. Open Shopify Admin > Apps > PH Multi Carrier Shipping Label App and confirm the affected store is using FedEx REST, not an older SOAP path.
2. Go to an order or checkout-rate scenario that reproduces FedEx REST rate fetching.
3. Trigger rates more than once, especially after enough idle time that token refresh is likely.
4. Confirm rates return without a timeout banner, endless loader, or forced retry loop.
5. If the issue still appears, capture the FedEx REST request/response log and the exact timestamp of the failure.

Expected Behaviour

What support should observe	How to confirm
FedEx REST rates still load when auth refresh happens	Run repeated rate checks after an idle period
No customer-facing timeout loop during token refresh	Confirm the UI does not stall or require manual retries
Escalation evidence is clean if it fails	Collect request log, store URL, carrier account, and affected order

Merchant-Safe Explanation

This update improves the reliability of FedEx REST rate retrieval, especially around background authentication refreshes, so customers should see fewer timeout-style interruptions.

Common Questions & Troubleshooting

- › If rates fail only for one store, verify the exact FedEx REST account and credentials first.
- › If the error is a generic carrier outage rather than a timeout during refresh, treat it separately from this card.
- › If checkout rates fail but order-level label generation still works, capture both flows because that difference helps engineering narrow the issue.

Support Escalation Packet

- › Story card: ZI-491
- › Ticket: #379340
- › Store URL, carrier account, order/cart scenario, timezone-correct timestamp
- › Screenshot of the UI failure and the matching FedEx REST request/response log

ZI-487 - CSV signature update feature broken post-REST migration

Feature Summary

This card concerns a regression where a CSV-driven signature-related update stopped applying correctly after a REST migration. Support should validate that CSV import/update still saves the intended signature setting and that the updated value is honored in the downstream shipment flow.

Toggles & Prerequisites

Check	What to confirm
Release	Confirm the build includes the post-migration CSV fix
Field scope	Confirm from card/store context whether the CSV updates product-level signature settings, service options, or document signature data
Platform	Shopify by default
Toggle	No toggle detected locally

Step-by-Step Support Walkthrough

1. Open the same area and CSV template type referenced by the card or merchant workflow.
2. Import or update a sample row that changes the signature-related field.
3. Reopen the affected product, order, or config record inside MCSL and confirm the value persisted.
4. Run the downstream shipment or document flow that uses that signature setting.
5. Confirm the updated value is reflected in the UI or output instead of being ignored after save/import.

Expected Behaviour

What support should observe	How to confirm
CSV update succeeds without silently dropping the signature field	Reopen the updated record in MCSL
Updated signature setting is used downstream	Check the shipment/document behavior that depends on the field

What support should observe	How to confirm
No manual re-entry is needed after import	Compare saved value before and after refresh

Merchant-Safe Explanation

This fix restores the expected CSV update behavior so signature-related settings can be managed in bulk again without being lost after import.

Common Questions & Troubleshooting

- › If the CSV uploads successfully but the value does not apply, capture both the import result and the downstream screen where the setting is missing.
- › If the merchant is changing a different signature field than the one covered by the card, confirm the exact column name before escalating.
- › If the issue happens only on older CSV templates, attach the template header row in the escalation.

Support Escalation Packet

- › Story card: ZI-487
- › Ticket: #379098
- › CSV sample used, affected field name, store URL, product/order identifiers
- › Before/after screenshots showing the saved value did not persist or apply

ZI-007 - Order notes not synced after import

Feature Summary

This card addresses missing order notes after order import into MCSL. Support should verify that notes present on the source order now appear in the imported order view and remain available for shipping operations that rely on those notes.

Toggles & Prerequisites

Check	What to confirm
Release	Confirm the store is on the fix build
Source platform	Shopify by default; verify if the merchant uses another supported platform
Order import path	Confirm the merchant is using the same import flow covered by the card
Toggle	No toggle detected locally

Step-by-Step Support Walkthrough

1. Open the source order in Shopify Admin and confirm it contains order notes or additional order instructions.
2. Import or refresh the same order into the PH Multi Carrier Shipping Label App.
3. Open the order inside the ORDERS tab and inspect the order details/summary.
4. Confirm the notes are visible after import and match the source order content.

5. Refresh the order once more to make sure the notes do not disappear on re-sync.

Expected Behaviour

What support should observe	How to confirm
Source order notes sync into MCSL	Compare Shopify order notes to the ORDERS view
Notes remain visible after refresh	Re-sync the order and recheck
Shipping workflow can proceed with the synced notes in place	Confirm support can still prepare the shipment normally

Merchant-Safe Explanation

This fix makes imported order notes stay in sync so merchants and support teams can see the same order instructions in MCSL that exist in the source store.

Common Questions & Troubleshooting

- › If only one note type is missing, confirm whether it is a standard order note, order attribute, or another custom field.
- › If the order imported before the fix, try a fresh sync/refresh before treating it as unresolved.
- › If the source platform is not Shopify, include the exact platform name and the order field label used there.

Support Escalation Packet

- › Story card: ZI-007
- › Ticket: #304193
- › Store URL, source order number, screenshot from source platform, screenshot from MCSL ORDERS view

ZI-058 - eParcel bulk label generation delay (8+ sec consistently)

Feature Summary

Bulk label generation was consistently slow because the eParcel legacy flow made unnecessary shipment-status polling calls. The intended fix improves bulk label throughput for Australia Post eParcel and StarTrack and should not be validated with MyPost Business-only evidence.

Toggles & Prerequisites

Check	What to confirm
Release	Store is on the release path containing the performance fix
Carrier scope	Australia Post eParcel legacy API or StarTrack
Toggle	<code>australiaPost.skip.get.shipment.enabled</code> is enabled for the store/account
Platform	Shopify by default

Step-by-Step Support Walkthrough

1. Confirm the merchant uses Australia Post eParcel or StarTrack in MCSL.
2. Confirm the store/account has `australiaPost.skip.get.shipment.enabled` enabled.
3. Open the ORDERS tab and select multiple eParcel-ready orders.
4. Run bulk label generation and watch the orders move to success.
5. Compare the observed runtime against the prior 8+ second per-label behavior if historical evidence is available.

Expected Behaviour

What support should observe	How to confirm
Bulk label generation completes faster	Compare runtime for a multi-order batch
Orders are not stuck behind extra shipment polling	Watch status progression in the order grid
Scope remains limited to eParcel/StarTrack legacy flow	Do not use MyPost Business-only evidence for sign-off

Merchant-Safe Explanation

This update improves the speed of bulk label generation for the affected Australia Post flows so larger batches should move through the app more smoothly.

Common Questions & Troubleshooting

- › If labels are still slow, verify the exact carrier path is eParcel legacy or StarTrack, not MyPost Business.
- › If labels fail rather than delay, treat that as a separate issue and gather carrier response evidence.
- › If only one or two labels are slow, compare against a larger batch before concluding the performance fix failed.

Support Escalation Packet

- › Story card: ZI-058
- › Ticket: #380339
- › Store URL, carrier account, batch size, elapsed time, request-log screenshots, toggle state

ZI-043 - Packing slip sort helper

Feature Summary

This card appears to add or fix helper behavior for sorting packing slip output. Support should validate that the packing slip order is now predictable and follows the intended grouping or sort logic in the affected document flow.

Toggles & Prerequisites

Check	What to confirm
Release	Confirm the packing-slip helper change is live
Document flow	Confirm the merchant uses app-generated packing slips

Check	What to confirm
Sort expectation	Confirm from card/store context what order should be used
Toggle	No toggle detected locally

Step-by-Step Support Walkthrough

1. Open an order with multiple lines that makes packing-slip sorting easy to observe.
2. Generate or re-download the packing slip from the app's document flow.
3. Compare the item order on the packing slip against the expected sort behavior from the card or merchant example.
4. Repeat with another order if the first one includes only simple single-line items.
5. If incorrect, capture both the order data and the generated packing slip PDF.

Expected Behaviour

What support should observe	How to confirm
Packing slip line order is consistent	Generate the same slip twice and compare
Sort order matches the intended helper behavior	Compare with card/store expectation
No unrelated packing-slip content is broken	Check item names, quantities, and addresses still render normally

Merchant-Safe Explanation

This change improves how packing slip items are ordered, making the document easier to read and use during fulfillment.

Common Questions & Troubleshooting

- › If the merchant expects a custom sort order, confirm whether the card covers that exact rule or only a standard helper improvement.
- › If only one document template is affected, include the template name in the escalation.
- › If the slip renders correctly in one browser and not another, attach the generated PDF itself rather than a screen-only capture.

Support Escalation Packet

- › Story card: ZI-043
- › Ticket: #377526
- › Source order, generated packing slip PDF, expected sort order example, store URL

ZI-029 - Bundle product support missing

Feature Summary

This card concerns missing support for bundle products in the MCSL workflow. Support should validate that bundle-based orders can now be imported, prepared, and processed without dropping item data or blocking shipment setup.

Toggles & Prerequisites

Check	What to confirm
Release	Confirm the bundle support change is deployed
Product type	Confirm the affected items are true bundle/composite products in the source store
Platform	Shopify by default
Toggle	No toggle detected locally; confirm from card/store context

Step-by-Step Support Walkthrough

1. Open a source order containing a bundle product.
2. Sync or import that order into MCSL.
3. Open the order in the ORDERS tab and confirm the bundle product data appears correctly for shipment preparation.
4. Attempt rate calculation or label preparation for the order.
5. Confirm the order is not blocked because the bundle item is missing, duplicated incorrectly, or flattened in an unusable way.

Expected Behaviour

What support should observe	How to confirm
Bundle-product orders import into MCSL without breaking	Compare source order to imported order
Shipment preparation remains possible	Open Prepare Shipment / Generate Label
Item data stays usable for support and fulfillment	Confirm names, quantities, and package selection still make sense

Merchant-Safe Explanation

This update improves support for bundle-product orders so merchants do not have to work around those orders manually before shipping.

Common Questions & Troubleshooting

- › If the merchant uses an app-generated bundle model, include the app name in the escalation.
- › If the issue is really packaging math rather than order import, note that separately because the engineering owner may differ.
- › If the bundle shows as separate child items, include whether that is acceptable or part of the problem.

Support Escalation Packet

- › Story card: ZI-029
- › Ticket: #372492
- › Source platform, order number, bundle product example, imported-order screenshot, store URL

ZI-018 - DPD services not appearing via EasyPost

Feature Summary

This card concerns missing DPD services when the merchant uses EasyPost as the carrier connection layer. Support should validate that the expected DPD services now appear in the EasyPost-backed flow and can be selected for shipment processing.

Toggles & Prerequisites

Check	What to confirm
Carrier path	EasyPost account is active and configured for the affected store
Service scope	Confirm the merchant expects DPD services specifically through EasyPost
Platform	Shopify by default
Toggle	No toggle detected locally

Step-by-Step Support Walkthrough

1. Open hamburger menu > Carriers and confirm the store uses EasyPost for the affected carrier flow.
2. Open an order that should qualify for the DPD services mentioned by the merchant.
3. Run rate calculation or label preparation using the EasyPost-backed carrier flow.
4. Check whether the expected DPD services now appear in the rate/service selection area.
5. If still missing, capture the request log and the exact ship-from/ship-to scenario used.

Expected Behaviour

What support should observe	How to confirm
Expected DPD services appear through EasyPost	Review available service list on the affected order
Support can proceed to shipment selection	Service can be chosen, not just displayed
Missing-service escalations contain enough context	Include addresses, parcel details, and EasyPost account path

Merchant-Safe Explanation

This fix restores the expected DPD service availability for merchants using the EasyPost-backed workflow.

Common Questions & Troubleshooting

- › If no DPD services appear, verify the issue is not an account enablement or origin/destination eligibility problem.
- › If one service appears but another does not, list the exact service names expected by the merchant.
- › If the merchant is not actually using EasyPost for DPD, treat it as the wrong workflow for this card.

Support Escalation Packet

- › Story card: ZI-018
- › Ticket: #366630
- › EasyPost account path, order scenario, expected DPD services, store URL, request-log screenshot

ZI-098 - PostNL service code 6942 (Boxable Track & Trace) not available

Feature Summary

This card addresses a missing PostNL service option, specifically service code 6942 for Boxable Track & Trace. Support should verify that the service is now available where merchants select eligible PostNL services and that the order can proceed with that option.

Toggles & Prerequisites

Check	What to confirm
Carrier account	PostNL account is connected in hamburger menu > Carriers
Service scope	Merchant expects PostNL service code 6942 for the tested shipment type
Platform	Shopify by default
Toggle	No toggle detected locally

Step-by-Step Support Walkthrough

1. Open the PostNL carrier configuration and confirm the account is active.
2. Prepare a shipment/order that matches the merchant's Boxable Track & Trace scenario.
3. Run the service or rate selection flow.
4. Confirm service code 6942 is available for selection when the shipment qualifies.
5. If available, complete label preparation to make sure the service is usable and not only visible.

Expected Behaviour

What support should observe	How to confirm
PostNL service code 6942 appears for eligible shipments	Review the service selection result
The service can be used for shipment processing	Continue into label creation
No manual workaround is required for that service	Compare against the merchant's previous limitation

Merchant-Safe Explanation

This change adds the missing PostNL service option so eligible shipments can use Boxable Track & Trace directly in MCSL.

Common Questions & Troubleshooting

- › If the service still does not appear, verify the shipment actually qualifies for that PostNL service.

- › If the service appears in config but not on the order, include origin, destination, weight, and package type in the escalation.
- › If the merchant expects a renamed service label, include the code and the visible UI name.

Support Escalation Packet

- › Story card: ZI-098
- › Ticket: #379796
- › Store URL, PostNL account, shipment details, screenshot of service list, request-log screenshot if available

ZI-038 - DHL Express "reason for return" field not supported

Feature Summary

This card covers missing support for a DHL Express return-related field, `reason for return`. Support should verify that the return flow now provides the required field where applicable and that return shipments/documents reflect the chosen value.

Toggles & Prerequisites

Check	What to confirm
Carrier account	DHL Express is active in hamburger menu > Carriers
Flow type	Confirm this is a DHL return shipment flow, not a standard outbound-only shipment
Platform	Shopify by default
Toggle	Confirm from card/store context if the field is rollout-gated

Step-by-Step Support Walkthrough

1. Open a DHL Express return-shipment scenario in the app.
2. Go to the order or return flow where return-specific customs/document inputs are configured.
3. Confirm a `reason for return` field is available when the shipment requires it.
4. Generate the return shipment or its documents using a known test value.
5. Confirm the chosen value is reflected in the output or the DHL-facing flow instead of being ignored.

Expected Behaviour

What support should observe	How to confirm
The DHL return flow exposes a reason-for-return input where required	Check the return shipment setup UI
The chosen value is carried through the process	Compare selected value to final output/log evidence
Outbound non-return flows remain unaffected	Run a normal DHL shipment as a control if needed

Merchant-Safe Explanation

This update improves DHL return-shipment handling by allowing the required return reason information to be captured in the supported flow.

Common Questions & Troubleshooting

- › If the field is missing entirely, confirm the merchant is using a return flow and not a standard outbound shipment.
- › If the field is visible but seems ignored, capture the selected value and the final label/document output.
- › If the merchant asks which return reasons are supported, confirm from the live dropdown or card evidence rather than guessing.

Support Escalation Packet

- › Story card: ZI-038
- › Ticket: #377217
- › Store URL, DHL account, order/return scenario, selected return reason, output screenshot

ZI-484 - Yearly plan billing not yet supported in MCSL app

Feature Summary

This card is about yearly billing-plan support. Because the title indicates a support gap, support should first confirm whether the release in question adds yearly-plan availability or whether the card is still documenting a known limitation for some stores.

Toggles & Prerequisites

Check	What to confirm
Rollout status	Confirm from card/store context whether yearly billing is enabled, partially rolled out, or still unavailable
Account scope	Confirm which subscription plan and billing screen the merchant is using
Platform	Shopify app billing flow by default
Toggle	Confirm from card/store context

Step-by-Step Support Walkthrough

1. Open the merchant's subscription or plan-management page in the app.
2. Confirm whether a yearly plan option should be visible for that store under the current rollout.
3. If yearly billing is expected to be supported, verify the plan option displays correctly and can be selected without error.
4. If yearly billing is not yet available for that store, avoid promising it and position the current state as rollout-limited.
5. Capture the billing screen and the exact merchant expectation if the observed behavior differs from the card status.

Expected Behaviour

What support should observe	How to confirm
Support knows whether yearly billing is available or still gated	Check card/store rollout context first
Eligible stores can see or use the yearly plan if released	Verify on the subscription page
Ineligible stores are not incorrectly promised the feature	Use the confirmed rollout status in merchant communication

Merchant-Safe Explanation

Yearly billing availability depends on the rollout tied to this card. Support should confirm the store's current eligibility before promising that plan option.

Common Questions & Troubleshooting

- › If the merchant sees only monthly plans, do not assume it is a bug until rollout status is confirmed.
- › If the plan appears but checkout fails, capture the billing-screen path and any browser-console-visible error screenshot if available.
- › If the merchant was manually told yearly billing is available, include that context in the escalation.

Support Escalation Packet

- › Story card: ZI-484
- › Ticket: #381931
- › Store URL, current plan page screenshot, expected billing option, rollout confirmation source

ZI-472 - USPS Media Mail service not available in app

Feature Summary

This card addresses missing USPS Media Mail availability inside MCSL. Support should verify that Media Mail now appears for eligible USPS shipments and that merchants can use it without manual workaround.

Toggles & Prerequisites

Check	What to confirm
Carrier path	Confirm whether the store uses USPS directly or USPS through a supported integration path
Eligibility	Media Mail shipment contents and origin/destination meet USPS eligibility
Platform	Shopify by default
Toggle	No toggle detected locally

Step-by-Step Support Walkthrough

1. Open an order that qualifies for USPS Media Mail based on the merchant's use case.
2. Run the USPS service/rate selection flow in MCSL.
3. Confirm Media Mail appears for the eligible order.

4. Continue through label generation to verify the service is usable, not just visible.
5. If missing, capture the full shipment context because USPS eligibility rules often affect service display.

Expected Behaviour

What support should observe	How to confirm
Media Mail appears for eligible USPS scenarios	Review the service list on the order
The service can be used end to end	Continue to label generation
Ineligible scenarios still hide the service appropriately	Compare with a non-qualifying control order if needed

Merchant-Safe Explanation

This change adds or restores USPS Media Mail support for eligible shipments so merchants can choose it directly in the app.

Common Questions & Troubleshooting

- › If the merchant's product type is not Media Mail-eligible, service absence may be expected.
- › If the store uses USPS through a partner path, include that integration detail in the escalation.
- › If one USPS service family appears but Media Mail does not, include the full service list screenshot.

Support Escalation Packet

- › Story card: ZI-472
- › Ticket: #302656
- › Store URL, USPS account path, order details, service-list screenshot, label attempt result

ZI-006 - USPS Ground Advantage Cubic service not implemented

Feature Summary

This card concerns support for USPS Ground Advantage Cubic. Support should verify whether the release adds the service to eligible USPS flows and whether cubic-eligible shipments can surface and use the service correctly.

Toggles & Prerequisites

Check	What to confirm
Carrier path	Confirm the USPS integration path used by the merchant
Eligibility	Shipment qualifies for Ground Advantage Cubic based on the account and package scenario
Platform	Shopify by default
Toggle	No toggle detected locally

Step-by-Step Support Walkthrough

1. Prepare a USPS shipment that should qualify for Ground Advantage Cubic.
2. Run the service/rate lookup in MCSL.
3. Confirm Ground Advantage Cubic appears in the service list if the release adds it.
4. Select the service and attempt label generation.
5. If unavailable, capture the shipment details and whether other USPS services appear normally.

Expected Behaviour

What support should observe	How to confirm
Ground Advantage Cubic appears for eligible scenarios	Review USPS service list
The service can be selected for label generation	Continue through shipment creation
Non-eligible shipments do not falsely expose the service	Compare with a control order if needed

Merchant-Safe Explanation

This update adds support for the USPS Ground Advantage Cubic option in the eligible MCSL shipping flow.

Common Questions & Troubleshooting

- › If the merchant expects the service because of a carrier announcement, confirm the exact MCSL release first.
- › If the service is absent only on one account, include the USPS provider path in the escalation.
- › If the issue is really package-dimension math rather than service display, note that separately.

Support Escalation Packet

- › Story card: ZI-006
- › Ticket: #299137
- › Store URL, USPS account path, package details, service-list screenshot, label attempt result

ZI-010 - Subscription plans page error on Safari

Feature Summary

This card addresses a browser-specific problem on Safari affecting the subscription plans page. Support should verify that the page now loads and functions correctly on Safari without blocking the merchant from reviewing or choosing plans.

Toggles & Prerequisites

Check	What to confirm
Browser	Reproduce on Safari using the merchant's reported version when possible
Scope	Confirm the issue is on the subscription plans page
Platform	Shopify app billing/subscription page

Check	What to confirm
Toggle	No toggle detected locally

Step-by-Step Support Walkthrough

1. Open the subscription plans page in Safari.
2. Confirm the page loads without a blank screen, script error, or blocked interaction.
3. Verify the plan cards, buttons, and billing details render correctly.
4. If the page previously failed during selection, attempt the same click path again.
5. If the issue persists, compare briefly in Chrome to confirm it is Safari-specific.

Expected Behaviour

What support should observe	How to confirm
Subscription page opens correctly in Safari	Load the page fresh in Safari
Plan details and actions are usable	Interact with the visible plan controls
Safari no longer blocks the merchant from progressing	Compare against the earlier failing step

Merchant-Safe Explanation

This fix resolves a Safari-specific issue on the subscription plans page so merchants using that browser can manage plans normally.

Common Questions & Troubleshooting

- › If the page still fails only on one Safari version, capture the version exactly.
- › If the merchant uses a content blocker or unusual privacy setting, include that detail.
- › If the same error now happens in all browsers, do not treat it as Safari-only.

Support Escalation Packet

- › Story card: ZI-010
- › Ticket: #338603
- › Safari version, macOS version if known, store URL, screenshot/video of the failing page

ZI-475 - USPS Flat Rate Box dimensions incorrect and packing logic no

Feature Summary

This card appears to cover incorrect USPS Flat Rate Box dimensions and the downstream packing logic that depends on them. Support should validate that the right USPS flat-rate package dimensions are used and that shipment packing behavior no longer chooses or rejects boxes incorrectly because of bad size data.

Toggles & Prerequisites

Check	What to confirm
Carrier scope	USPS flat-rate packaging flow
Scenario	Use an order where flat-rate package selection is easy to observe
Platform	Shopify by default
Toggle	No toggle detected locally

Step-by-Step Support Walkthrough

1. Open or create an order that should be packed into the affected USPS Flat Rate Box.
2. Review the package or packing-method selection in MCSL.
3. Confirm the expected flat-rate box appears with the correct dimensions or is chosen correctly by the packing logic.
4. Continue through rate calculation or label preparation.
5. If the wrong box is chosen, capture the order items, package list, and visible box dimensions.

Expected Behaviour

What support should observe	How to confirm
Correct USPS flat-rate box dimensions are used	Inspect the package details shown in the app
Packing logic does not mis-handle the shipment because of bad dimensions	Continue through rate/label flow
USPS shipment can proceed without manual box workaround	Compare against prior merchant workaround if known

Merchant-Safe Explanation

This update corrects the USPS flat-rate box setup used by MCSL so package selection and packing behavior match the intended box definitions more reliably.

Common Questions & Troubleshooting

- › If the merchant uses custom packaging rules, confirm whether the issue is the built-in flat-rate package or a custom package record.
- › If the wrong package is selected only for one SKU mix, include those SKUs in the escalation.
- › If rates are wrong but the package looks right, capture both the packaging and rate views.

Support Escalation Packet

- › Story card: ZI-475
- › Ticket: #364411
- › Store URL, order number, affected USPS package name, screenshot of visible dimensions, label/rate result

ZI-478 - Shipment notification email missing carrier name

Feature Summary

This card concerns shipment notification emails that do not show the carrier name. Support should verify that the carrier name now appears in the relevant notification email template/output and matches the actual shipment carrier used.

Toggles & Prerequisites

Check	What to confirm
Notification flow	Confirm the email is generated by the affected MCSL shipment flow
Shipment carrier	Use a shipment where the carrier is obvious and verifiable
Platform	Shopify by default
Toggle	No toggle detected locally

Step-by-Step Support Walkthrough

1. Generate or trigger a shipment notification email from the affected store.
2. Open the email received by the test recipient.
3. Confirm the carrier name is present in the email content where merchants or customers expect it.
4. Compare the displayed carrier name with the actual carrier used on the shipment.
5. If missing, capture the email content and the corresponding order/shipment details in MCSL.

Expected Behaviour

What support should observe	How to confirm
Shipment email includes the carrier name	Review the delivered email body
Displayed carrier matches the actual shipment carrier	Compare email content to order/shipment details
Other notification content remains intact	Check tracking and order references still render correctly

Merchant-Safe Explanation

This fix makes shipment notification emails clearer by including the carrier name in the expected email content.

Common Questions & Troubleshooting

- › If the merchant uses a custom notification template, mention that in the escalation.
- › If the issue happens only for one carrier, include the exact carrier name.
- › If the email is missing entirely, treat delivery failure separately from this content issue.

Support Escalation Packet

- › Story card: ZI-478
- › Ticket: #376463
- › Store URL, shipment/order number, email screenshot, actual carrier used

ZI-480 - PostNord international label and CN22 must print o

Feature Summary

This card appears to address PostNord international shipments where both the label and CN22 customs document must print correctly together. Support should validate that the required shipping document set is produced for the qualifying PostNord international flow.

Toggles & Prerequisites

Check	What to confirm
Carrier account	PostNord account is active
Shipment scope	International PostNord order that requires CN22
Platform	Shopify by default
Toggle	Confirm from card/store context if document printing is rollout-gated

Step-by-Step Support Walkthrough

1. Open an international PostNord order that requires customs documentation.
2. Generate the shipment and download/print the available documents.
3. Confirm the shipping label is present and valid.
4. Confirm the CN22 document also prints or is included in the generated document set.
5. If either item is missing, capture the generated files and the order's international destination details.

Expected Behaviour

What support should observe	How to confirm
PostNord international shipment produces the label successfully	Review the generated label output
CN22 is also available when required	Review the printed/downloaded document set
Support can send both outputs to the merchant if needed	Confirm both files open cleanly

Merchant-Safe Explanation

This update makes sure the required PostNord international shipping documents are available together for the affected customs flow.

Common Questions & Troubleshooting

- › If the order does not actually require CN22, document absence may be expected.
- › If the label prints but CN22 does not, include the destination country and product details in the escalation.
- › If the merchant receives a combined PDF, mention whether the CN22 should be separate or bundled.

Support Escalation Packet

- › Story card: ZI-480

- › Ticket: #379784
- › Store URL, destination country, PostNord account, generated label/CN22 files or screenshots

ZI-483 - Plugin fails to load due to isActive:false flag ca

Feature Summary

This card addresses a plugin/app load failure tied to an `isActive:false` state or flag. Support should validate that the affected plugin now loads correctly when the store/integration should be active and that the inactive-state handling no longer blocks startup incorrectly.

Toggles & Prerequisites

Check	What to confirm
Affected build	Confirm the store is on the build containing the load fix
Scope	Confirm which plugin/module was failing to load
Activation state	Confirm whether the store or plugin should be active in this scenario
Toggle	No toggle detected locally; activation logic itself is the focus

Step-by-Step Support Walkthrough

1. Open the affected plugin/module in the same environment where the merchant saw the load failure.
2. Confirm the store or integration should be active for that scenario.
3. Reload the page or app entry path.
4. Confirm the plugin/module loads instead of failing because of an incorrect inactive-state check.
5. If it still fails, capture the visible error and any state indicator showing active versus inactive.

Expected Behaviour

What support should observe	How to confirm
Plugin/module loads for stores that should be active	Reopen the affected entry path
Inactive-state handling no longer blocks valid cases	Compare with the previous failing scenario
Escalation includes the activation context if it still fails	Capture state and environment details

Merchant-Safe Explanation

This fix resolves a startup/load issue where the app could treat an active setup as inactive and fail to open correctly.

Common Questions & Troubleshooting

- › If the merchant truly is inactive or suspended, the behavior may be expected.
- › If the issue happens only in one environment, include whether it is production, staging, or a special store setup.

- › If a cached session changes the behavior after refresh, mention that in the escalation.

Support Escalation Packet

- › Story card: ZI-483
- › Ticket: #386476
- › Store URL, module/page URL, visible error, active/inactive state evidence

ZI-490 - USPS transit time buffer feature in development

Feature Summary

This card is explicitly described as in development, so support should treat it as rollout-gated until the store context confirms it is live. The feature appears to involve buffering or adjusting USPS transit-time display logic.

Toggles & Prerequisites

Check	What to confirm
Status	Confirm whether the store is on an early rollout or whether the card is still not GA
Carrier path	USPS or USPS/Stamps flow in question
Platform	Shopify by default
Toggle	Confirm from card/store context before promising availability

Step-by-Step Support Walkthrough

1. Check the card/store rollout status before testing anything with the merchant.
2. If the feature is live for the store, run the USPS rate scenario where transit time buffering should apply.
3. Compare the shown transit-time behavior against the expected buffered result from the card context.
4. If the feature is not yet live, position it as not generally available instead of treating absence as a bug.
5. Capture screenshots and the exact USPS scenario if the observed result conflicts with rollout status.

Expected Behaviour

What support should observe	How to confirm
Support knows whether the feature is live before promising it	Confirm rollout status first
Rolled-out stores show the intended transit-time behavior	Test the USPS rate scenario
Non-rolled-out stores are not treated as bugs by default	Use rollout status in merchant communication

Merchant-Safe Explanation

This card relates to transit-time display logic that may still be under controlled rollout. Support should confirm the store's availability before presenting it as a released feature.

Common Questions & Troubleshooting

- › Do not promise the feature based only on the card name because it is described as in development.
- › If the merchant was told the feature is already live, include who communicated that and when.
- › If transit times are missing entirely, compare with the separate USPS Stamps transit-days issue below.

Support Escalation Packet

- › Story card: ZI-490
- › Ticket: #377113
- › Store URL, rollout confirmation source, USPS scenario, screenshots of shown transit time

SL item - Estimated Transit days not showing up at checkout in USPS Stamps

Feature Summary

This support item covers missing estimated transit days at checkout for USPS Stamps. Support should validate that checkout rates now show transit-day information when the carrier/service and store configuration support it.

Toggles & Prerequisites

Check	What to confirm
Carrier path	USPS via Stamps integration
Checkout setup	Live checkout-rate display is configured for the store
Service scope	Use a USPS Stamps service that should expose transit days
Toggle	No toggle detected locally

Step-by-Step Support Walkthrough

1. Confirm the store uses USPS Stamps for checkout rates.
2. Run a checkout scenario that returns USPS Stamps rates.
3. Review the visible rate lines and confirm whether estimated transit days appear.
4. If not visible, compare one other carrier or service if available to check whether the issue is USPS-specific.
5. Capture both the checkout screen and the matching rate configuration in the app if transit days are still absent.

Expected Behaviour

What support should observe	How to confirm
USPS Stamps checkout rates show estimated transit days where supported	Review the live checkout rate lines
Missing transit days are no longer a USPS-specific display gap	Compare across eligible services if needed
Support can explain whether transit-day display is service-dependent	Use the observed eligible/ineligible examples

Merchant-Safe Explanation

This fix restores the transit-day estimate display for the supported USPS Stamps checkout flow so customers can see delivery timing more clearly.

Common Questions & Troubleshooting

- › If checkout rates appear but transit days do not, capture the exact service names shown.
- › If the store uses a custom checkout theme, note that in the escalation.
- › If transit days are missing across all carriers, treat it as a broader checkout-rendering issue.

Support Escalation Packet

- › Story item: Estimated Transit days not showing up at checkout in USPS Stamps
- › Store URL, checkout screenshot, USPS Stamps configuration screenshot, service names shown

ZI-477 - PostNord customs invoice duty calculated on subtotal not grand total

Feature Summary

This card concerns duty/customs invoice calculation logic for PostNord, where duty was being based on subtotal rather than grand total. Support should validate that the customs invoice now uses the intended total basis for the affected scenario.

Toggles & Prerequisites

Check	What to confirm
Carrier account	PostNord is active
Shipment scope	International/customs flow that generates the affected invoice
Pricing example	Use an order where subtotal versus grand total difference is visible
Toggle	No toggle detected locally

Step-by-Step Support Walkthrough

1. Open a PostNord international order where duty/tax calculation can be inspected.
2. Generate the shipment and its customs invoice/document.
3. Compare the invoice duty basis against the order's subtotal and grand total.
4. Confirm the behavior matches the fixed grand-total expectation for the card.

5. If incorrect, capture the order totals and the generated invoice side by side.

Expected Behaviour

What support should observe	How to confirm
Duty/customs invoice calculation no longer uses subtotal incorrectly	Compare invoice values to order totals
PostNord customs documents reflect the intended basis	Review the generated customs invoice
Support can explain the correction clearly to the merchant	Use the before/after total comparison

Merchant-Safe Explanation

This fix corrects how the affected PostNord customs invoice value is derived so the calculation aligns with the intended order total basis.

Common Questions & Troubleshooting

- › If the merchant expects shipping charges or taxes to be included, capture that expectation explicitly.
- › If one order is correct and another is not, include both examples with their total breakdowns.
- › If the issue appears only on the document and not in the order view, mention that distinction.

Support Escalation Packet

- › Story card: ZI-477
- › Ticket: #376223
- › Store URL, order totals breakdown, generated customs invoice, PostNord account details

ZI-494 - Customer concern about DHL SOAP API v2 deprecation resolved through REST migration

Feature Summary

This card is primarily about support positioning and verification after migrating away from a deprecated DHL SOAP v2 path to REST. Support should validate that the merchant is using the REST-backed flow and explain that the deprecation concern is resolved through that migration.

Toggles & Prerequisites

Check	What to confirm
Migration status	DHL REST migration is active for the affected store/account
Carrier path	Merchant is no longer relying on the deprecated SOAP v2 path
Platform	Shopify by default
Toggle	No toggle detected locally; migration state is the key prerequisite

Step-by-Step Support Walkthrough

1. Open the DHL carrier configuration for the affected store.
2. Confirm the account/path now uses the intended REST migration flow rather than SOAP v2.
3. Run a basic DHL rate or label scenario.
4. Confirm the workflow succeeds normally under the REST path.
5. Use the migration confirmation when explaining to the merchant why the prior deprecation concern is no longer blocking them.

Expected Behaviour

What support should observe	How to confirm
Store is on the REST-backed DHL path	Review the carrier configuration or release context
Core DHL workflow still works after migration	Run a basic rate or label test
Support can close the deprecation concern confidently	Tie the merchant explanation to the live REST path

Merchant-Safe Explanation

The previous DHL SOAP v2 deprecation concern is addressed by moving the affected flow to the current REST-based integration path.

Common Questions & Troubleshooting

- › If the merchant still references SOAP-specific behavior, confirm they are looking at the current store/account.
- › If rates work but labels fail, include both results because migration coverage may differ by flow.
- › If the carrier screen still shows legacy wording, mention that in the escalation.

Support Escalation Packet

- › Story card: ZI-494
- › Ticket: #330209
- › Store URL, DHL account path, screenshot confirming REST usage, rate/label test result

ZI-495 - DHL Paket label generation complete failure requiring emergency REST API migration

Feature Summary

This card concerns a severe DHL Paket label-generation failure that required an emergency move to a REST API path. Support should verify that the migrated path is active and that DHL Paket label creation now works for the previously blocked scenario.

Toggles & Prerequisites

Check	What to confirm
Migration status	Emergency REST migration is active for the affected DHL Paket flow

Check	What to confirm
Carrier account	Confirm the exact DHL Paket account used
Platform	Shopify by default
Toggle	No toggle detected locally; migration state is the key prerequisite

Step-by-Step Support Walkthrough

1. Confirm the affected store is on the migrated DHL Paket REST path.
2. Open an order that previously reproduced the complete label-generation failure.
3. Generate the DHL Paket label again.
4. Confirm the label now generates successfully instead of failing outright.
5. If it still fails, capture the order, carrier account, and the full visible error/result from the current REST path.

Expected Behaviour

What support should observe	How to confirm
DHL Paket labels generate successfully on the migrated path	Run the known-failing scenario again
The prior complete failure is no longer reproducible	Compare against the merchant's earlier error description
Support can differentiate migration success from unrelated carrier issues	Gather fresh evidence from the current path

Merchant-Safe Explanation

This emergency fix moved the affected DHL Paket label flow to a working REST-based path so merchants can generate labels again in the previously blocked scenario.

Common Questions & Troubleshooting

- › If labels still fail, confirm the merchant is testing the same carrier account and order type as before.
- › If the issue changed from total failure to a data-specific rejection, note that difference because it indicates the migration is at least partially active.
- › If the merchant asks whether SOAP is still in use, confirm the store is on the REST path before answering.

Support Escalation Packet

- › Story card: ZI-495
- › Ticket: #332163
- › Store URL, DHL Paket account, order number, fresh error screenshot, proof of migrated path

Trello 9F0eHYSW - Additional card requested by user

Feature Summary

This card was added from the Trello shortlink <https://trello.com/c/9F0eHYSW>, but the card title and body were not publicly readable from the current environment because Trello returned a permission-restricted response. It is included here as a placeholder support section so the combined PDF stays complete, without guessing the card name or behavior.

Toggles & Prerequisites

Check	What to confirm
Card title	Confirm directly from Trello access
Release	Confirm which release/package this card belongs to
Scope	Confirm affected carrier, platform, and workflow from card/store context
Toggle	Confirm from card/store context

Step-by-Step Support Walkthrough

1. Open the Trello card directly in an account that has access and capture the exact card title.
2. Confirm the affected MCSL area, carrier/platform scope, and whether the card is a bug fix, feature gap, or rollout note.
3. Reproduce the merchant workflow in the matching MCSL area.
4. Verify the intended before/after behavior using the card evidence and store context.
5. If needed, regenerate this section later with the full card details so the support guidance can be made specific.

Expected Behaviour

What support should observe	How to confirm
Support can map the shortlink to the correct card before advising the merchant	Open the card in Trello with proper access
No unsupported assumptions are made about this card	Use card/store evidence instead of guessing
The combined guide still tracks the requested card	Confirm the shortlink appears in this package

Merchant-Safe Explanation

This card has been included in the package, but its exact support guidance should be confirmed from the live Trello card before it is used on a customer call.

Common Questions & Troubleshooting

- › If you want, I can replace this placeholder with a full support section as soon as you share the card title or paste the card content.
- › Do not reuse another card's carrier or workflow assumptions for this shortlink.
- › If the card is access-restricted for support too, ask the internal owner for the approved AC/QA notes before using it externally.

Support Escalation Packet

- › Story card: Trello shortlink 9F0eHYSW
- › Trello URL: <https://trello.com/c/9F0eHYSW>
- › Exact card title, release, store URL, affected workflow, screenshots, and any request-log evidence gathered after access is confirmed
