

Regression cases: New Transit API

Regression cases: New Transit API

Scenario: International shipment uses new transit API for multi-package shipment

Given the FedEx REST rate changes feature toggle is ON

And the shipment is international

And max quantity handling is enabled

When the customer requests shipping rates at checkout with multiple items in cart

Then the new FedEx transit API should be called

And the shipment should be split into multiple packages correctly

And valid international shipping rates should be returned successfully

And the order summary should match the checkout rate

Scenario: International shipment checkout rate matches order summary

Given the FedEx REST rate changes feature toggle is ON

And the shipment is international

When the customer requests shipping rates at checkout

And places the order using an international carrier service

Then the shipping charge in the order summary should match the checkout rate

And the selected carrier service should remain unchanged after order creation

Regression cases: New Transit API

Scenario: International shipment with rate automation rule for products priced greater than or equal to 100

Given the FedEx REST rate changes feature toggle is ON

And the shipment is international

And a rate automation rule exists for the carrier

When the customer requests international shipping rates for products priced greater than or equal to 100

Then the new FedEx transit API should be called

And shipping rates should be returned successfully

And insured value or declared value should be included in the request

Scenario: International shipment label generation with delivery confirmation special service

Given the FedEx REST rate changes feature toggle is ON

And the shipment is international

And the product is configured with a delivery confirmation special service

When the order is imported into the MCSL app

And the merchant generates the shipping label

Then the new FedEx transit API should be called

And the label should be generated successfully

And the request XML should contain the correct delivery confirmation or signature details based on the configured product setting

And the shipment should be processed successfully
