

BDD Test Scenarios

MCSL fedex rest - fetch negotiate rate

Feature: FedEx REST rates exclude One Rate and return the correct negotiated or selected rate

Background

Given the merchant has FedEx REST configured in MCSL
And the store is eligible for the FedEx REST rate changes feature
And the product, address, and package data are valid for FedEx rating
And checkout rate display, order rate summary, and API response can be verified together

Scenarios

Scenario 1: Domestic shipment excludes FedEx One Rate when the exclude-One-Rate behavior is active

Given the FedEx REST rate changes feature toggle is ON
And the shipment is domestic
And the package uses a custom box with valid dimensions
When the customer requests shipping rates at checkout
Then the FedEx rate request should exclude One Rate pricing
And the response should not contain FedEx One Rate charges
And only the applicable negotiated or selected standard FedEx rates should be returned
And the rate shown at checkout should match the rate response
And the order summary shipping rate should match the checkout rate

Scenario 2: Domestic shipment returns normal domestic rates when One Rate exclusion is not active

Given the FedEx REST rate changes feature toggle is OFF
And the shipment is domestic
And the package uses a custom box with valid dimensions
When the customer requests shipping rates at checkout
Then the legacy FedEx rating flow should be used
And the system should behave as before the new change
And the checkout rate should match the returned FedEx response
And the order summary shipping rate should match the checkout rate

Scenario 3: International shipment uses old API when feature toggle is OFF

Given the FedEx REST rate changes feature toggle is OFF

And the shipment is international

When the customer requests shipping rates at checkout

Then the legacy rates API should be called

And duties and taxes data should not be sent in the request

And the returned rate should match the rate shown at checkout

And the order summary should match the checkout rate

Scenario 4: International shipment uses new transit API with duties and taxes disabled

Given the FedEx REST rate changes feature toggle is ON

And the shipment is international

And the merchant has disabled estimated duties and taxes

When the customer requests shipping rates at checkout

Then the new FedEx transit API should be called

And edtRequestType should be sent as NONE

And the checkout rate should be returned successfully without duties and taxes added

And the order summary should match the checkout rate

Scenario 5: International shipment uses new transit API with duties and taxes enabled

Given the FedEx REST rate changes feature toggle is ON

And the shipment is international

And the merchant has enabled estimated duties and taxes

When the customer requests shipping rates at checkout

Then the new FedEx transit API should be called

And edtRequestType should be sent as ALL

And duties and taxes should be included in the returned rating data

And the shipping charge shown at checkout should reflect the returned duties and taxes behavior correctly

And the order summary should match the checkout rate

Scenario 6: Domestic shipment must not send international duties and taxes fields

Given the FedEx REST rate changes feature toggle is ON
And the shipment is domestic
And the merchant has enabled estimated duties and taxes
When the customer requests shipping rates at checkout
Then international duties and taxes request fields should not be sent
And the domestic rate response should still be returned successfully
And checkout and order summary should remain consistent

Scenario 7: Rate request type LIST shows only list rate service at checkout

Given the FedEx REST rate changes feature toggle is ON
And the carrier rate request type is set to LIST
And the shipment is valid for FedEx rating
When the customer requests shipping rates at checkout
Then the FedEx request should ask for both LIST and ACCOUNT rates
And the checkout should display only the LIST rate result for the service
And the order summary should match the checkout rate

Scenario 8: Rate request type ACCOUNT shows only negotiated account rate at checkout

Given the FedEx REST rate changes feature toggle is ON
And the carrier rate request type is set to ACCOUNT
And the shipment is valid for FedEx rating
When the customer requests shipping rates at checkout
Then the FedEx request should ask for both LIST and ACCOUNT rates
And the checkout should display only the ACCOUNT negotiated rate for the service
And the order summary should match the checkout rate

Scenario 9: Rate request type PREFERRED returns preferred-priced services

Given the FedEx REST rate changes feature toggle is ON
And the carrier rate request type is set to PREFERRED
And the shipment is valid for FedEx rating
When the customer requests shipping rates at checkout
Then the FedEx request should use PREFERRED pricing selection
And the checkout should display only the preferred-priced service result
And the displayed rate should match the FedEx response selected by the system

Scenario 10: One Rate inclusion setting ON returns lower-rate selection behavior

Given the FedEx REST rate changes feature toggle is ON
And the shipment is domestic
And the merchant has enabled the One Rate related carrier setting
When the customer requests shipping rates at checkout
Then the rate display option sent to FedEx should be LOWER_RATE
And the returned service price should follow the lower-rate selection logic
And checkout and order summary should match the selected returned rate

Scenario 11: One Rate inclusion setting OFF excludes F1R rates

Given the FedEx REST rate changes feature toggle is ON
And the shipment is domestic
And the merchant has disabled the One Rate related carrier setting
When the customer requests shipping rates at checkout
Then the rate display option sent to FedEx should be SELECTED_RATES_EXCLUDING_F1R
And FedEx One Rate results should not be returned
And checkout and order summary should match the selected returned rate

Scenario 12: Carrier packaging with One Rate exclusion does not break rate retrieval

Given the FedEx REST rate changes feature toggle is ON
And the shipment is domestic
And the package uses FedEx carrier packaging
When the customer requests shipping rates at checkout
Then the system should return valid rates without error
And excluded One Rate behavior should still be honored as configured
And checkout and order summary should match

Scenario 13: Custom packaging with One Rate exclusion does not break rate retrieval

Given the FedEx REST rate changes feature toggle is ON
And the shipment is domestic
And the package uses custom packaging
When the customer requests shipping rates at checkout
Then the system should return valid rates without error
And excluded One Rate behavior should still be honored as configured
And checkout and order summary should match

Scenario 14: Multiple-package international shipment is rated successfully with the new API

Given the FedEx REST rate changes feature toggle is ON
And the shipment is international
And the shipment contains multiple packages
When the customer requests shipping rates at checkout
Then the new international rating flow should return valid rates
And duties and taxes behavior should follow the merchant setting
And checkout and order summary should match the returned result

Scenario 15: International freight shipment is rated successfully with the new API

Given the FedEx REST rate changes feature toggle is ON
And the shipment is international freight
When the customer requests shipping rates at checkout
Then the new international rating flow should return valid rates without breaking
And the selected rate should be displayed correctly at checkout
And the order summary should match the checkout rate

Scenario 16: International Saturday delivery rating does not break the new flow

Given the FedEx REST rate changes feature toggle is ON
And the shipment is international
And Saturday delivery is applicable in the request
When the customer requests shipping rates at checkout
Then the new international rating flow should return a valid result or a clean unsupported response
And the system should not show mismatched or duplicated rates
And the order summary should remain consistent with checkout

Scenario 17: Unsupported One Rate or SmartPost combinations for international shipments do not break checkout

Given the FedEx REST rate changes feature toggle is ON
And the shipment is international
And the request contains a service combination unsupported for international shipment such as One Rate or SmartPost
When the customer requests shipping rates at checkout
Then the system should not fail unexpectedly
And unsupported services should not be displayed as purchasable checkout options
And valid supported services should still be shown when available

Scenario 18: No mismatch between checkout rate and order summary after rate selection

Given the FedEx REST rate changes feature toggle is ON

And a FedEx rate is displayed at checkout

When the customer completes the order

Then the shipping amount stored in the order summary should exactly match the checkout rate

And there should be no mismatch between API response, checkout display, and order summary

Scenario 19: No negotiated rate available for account-rated request

Given the FedEx REST rate changes feature toggle is ON

And the carrier rate request type is set to ACCOUNT

And FedEx does not return an account-specific negotiated rate for the shipment

When the customer requests shipping rates at checkout

Then the system should handle the response gracefully

And it should not display an incorrect One Rate result as a fallback

And it should either show a valid fallback per business rule or no rate with a clear outcome

Scenario 20: Toggle-disabled store does not use the new international rate logic

Given the store does not satisfy the FedEx REST rate changes toggle condition

And the shipment is international

When the customer requests shipping rates at checkout

Then the new transit API should not be used

And the store should continue using the old rating behavior

And the response should remain stable without regression
